

5x DNA Loading Buffer Orange

Cat. No.: A608304

A608304

Cat. No.	Product	ID No.	Cap colour	Volume
A608304	DNA Loading Buffer Orange	5400300	Yellow	5 x 1 ml

Features

- Suitable for agarose and SDS DNA gels
- Suitable for TAE, TBE, SB and LB electrophoresis buffers
- 5x ready-to-use formulation
- Ficoll-based for convenient storage on RT

General Description

DNA loading buffers are used to load DNA samples to agarose or SDS DNA gels for gel electrophoresis.

DNA loading buffers serve three main purposes:

Firstly, they add density to the DNA samples, so the DNA sinks down into the well instead of floating up and mixing with the running buffer. To achieve this, high density reagents like glycerol, sucrose or Ficoll are added.

Secondly, loading buffers add visibility to the DNA sample. Loading buffers contain a coloured tracking dye to allow control of proper DNA sample loading.

And thirdly, loading buffers provide one or more tracking dyes to monitor the progress of DNA migration on the gel (figure 1). Commonly used tracking dyes are xylene cyanol FF, cresol red, bromophenol blue, and orange G, each migrating at a characteristic size (table 1).

Ampliqon offers 4 different loading buffers to allow the customer to choose the optimal system for a specific task. The loading buffers are formulated as a 5x solutions containing Ficoll, Tris-buffer, EDTA and either Xylene cyanol FF, Cresol Red, Bromophenol Blue or Orange G as tracking dye. For a 10 µl loading volume, add 2 µl 5x Loading Dye to 8 µl of your DNA sample, mix well and load on a gel.

Kit Components

5x Loading Buffer Orange

15 % Ficoll 400, 10 mM Tris-HCl pH 8.0, 50 mM EDTA, 0.4 % orange G.

Recommended Storage and Stability

Long term storage at -20 °C. Product expiry at -20 °C is stated on the label.

Option: Store at +4 °C for up to 6 months.

Quality Control

Each lot of Loading Buffer is functionally tested on an agarose gel.

How to choose the right loading buffer

Tracking dyes

The choice of the tracking dye is dependent on the size of the DNA fragments one wants to run. In general, the front of the tracking dye should not run at the size of the DNA fragments because especially dark dyes obscure the DNA bands.

It is best to choose a tracking dye that runs in front of the DNA fragments to analyze.

Figure 1: The three Ampliqon Loading Buffers were run on a 1 % agarose gel along with a DNA marker. The gel was pictured on white light and UV light and the dyes were correlated to the marker.

Table 1: Position of dye front of some tracking dyes on a 1 % agarose gel:

Dye:	Front at*:	Color:
Xylene cyanol FF	4000 – 5000 bp	Cyan
Cresol red	1000 – 2000 bp	Red
Bromphenol blue	300 – 500 bp	Blue
Orange G	50 – 150 bp	Orange

* The position of the dyes is dependent on the type of agarose, the percentage of the gel and the buffer used.
